

C# Lab – LINQing to Employees

Use the starter project – Lab - LINQingtoEmployees. In this project, there is an `Employee` class and the `Main` method, which creates and initializes an array of 5 `Employees`. It is your job to write the LINQ queries (and output the results to the console window) for the following requests:

- Find the employee(s) who have no first *and* last name
- Find the employee(s) who have a salary greater than \$50,000.00
- Obtain a list of *all* employees, sorted by last name, first name
- Find any employee(s) whose ID begins with the *capital* letter 'B'
- Find any employee(s) whose ID begins with the capital letter 'A'
- Find any employee(s) whose first name begins with the capital letter 'J'

Once you are finished, email me your project or copy the queries to a text file and email it to me.
